- ☒ **Timer Software -Replit**
- ☒ **What we want you to do Back to keeping everyone in a multiplayer replin sync. In the real world, we don't always work at the same time.Sometimes people leave then rejoin later, or lose their internetconnection and come back online. When people rejoin, we need theirclient to "catch up" to the current state of the repl so everyone has the same code in front of them! So when we catch up, we need to validate that a sequence of operational transformations will actually produce the most recent version of your code. It would be pretty terrible if I edited your file while you're gone, then you somehow end up with**

thewrong file contents when you rejoin later 🤖 For this challenge, you're going to write the OT validation function. The function will take in a string for the stale file contents, a string containing the latest file contents, and a JSON string containing the operations. -
